

SEAL ASSEMBLIES & ACCESORIES

LOCATOR TUBING SEAL ASSEMBLY

The locator seal assembly is generally used in installations where floating seals are required. The locator prevents downward movement of the tubing string once landed, but allows the seal to move with tubing contraction.

SEAL UNIT

Standard seal units are furnished with bonded nitrile seal rings and a 12 inch make-up length. The units may be ordered in various lengths and with severe service rings for high temperature and corrosive environment applications.

SPACER SUB

The spacer subs are used to get an optimum length between the seals unit. The spacers commonly are 24 in make-up length.

HALF MULE SHOE

The half mule shoe guide is standard for the Locator tubing seal assembly and allows for easy entry into the packer bore as well as when a wireline tool is run below of the completion
